

During harvest time Talbot's Mountain Gold LLLP does not spray any pesticides on our peaches. We only use them earlier in the growing season when certain pests attack our trees.

Additionally, you should know when we pack our peaches in the shed we use peroxyacetic acid and Hydrogen Peroxide (60 parts per million) to cleanse our peaches prior to packing. This provides additional assurance that harmful bacteria or other naturally occurring germs do not exist on the surface of our peaches at packing.

Hopefully this helps explain how we raise our peaches and the care we take to insure you receive the best tasting and safest peaches for your family. Should you need further information feel free to contact me by e-mail.
